Re: Influence of wells on aquifer

Mr. Dunkirk,

In reference to the well and proposed second well on the property located in Section 1 of Pitman Township, there would be less than three hundred feet of radial influence to the groundwater, from each well. This is based upon the design and construction of the bored wells that have been constructed in the shallow sandstone formation, which is the aquifer for these wells.

The wells would have no impact to the groundwater/wells of the farm located ½ mile south of your site.

If you have any questions, please call.

Sincerely,

Andrew L. Wiesenhofer
Reynolds Drilling Corporation
